

Building on the existing curriculum and the technical architecture of the ecosystem, here is a structured 10-module course outline for the ****Hyper-Vibe Coding Course****. This outline is designed for neurodivergent learners, moving from foundational "Vibe Coding" to mastering "autonomously alive" AI systems [1-3].

****Module 1: 🌱 Your First Vibe (Beginner)****

- * ****Learning Objective:**** Set up your local development environment and understand the "no-fluff" philosophy of the Hyperfocus Zone [1, 4].
- * ****Key Skills:**** Docker Desktop installation, cloning repositories, managing `.env`` files, and launching your first local 32-container stack [5-7].

****Module 2: 🗣️ Prompt Like a Pro (Beginner)****

- * ****Learning Objective:**** Master natural language as a high-level programming language to communicate with the AI engine [4, 8].
- * ****Key Skills:**** Prompt engineering for code generation, using AI to explain system patterns, and reducing "freezing" when faced with complex instructions [6].

****Module 3: 🏠 Build Your First App (Beginner → Mid)****

- * ****Learning Objective:**** Create a functional full-stack application using the "Natural Language → AI Code" workflow [1, 4].
- * ****Key Skills:**** Next.js frontend basics, connecting to a FastAPI backend, and implementing fast feedback loops for rapid development [1, 9, 10].

****Module 4: 🧠 Full Stack Vibe (Intermediate)****

- * ****Learning Objective:**** Deepen integration between frontends, backends, and databases [4].
- * ****Key Skills:**** Supabase database management, authentication with password validation, and utilizing the Vercel AI Gateway for agent interactions [1, 4, 11].

****Module 5: 🔥 HyperCode The Hyper Way (Advanced)****

- * ****Learning Objective:**** Dive into the core cognitive architecture and self-evolving AI agent swarms [3, 4].
- * ****Key Skills:**** Understanding the "Agent Crew" (Agent X, Orchestrator, Healer), managing Docker Compose profiles, and implementing the Evolutionary Pipeline for agents [10, 12, 13].

****Module 6: 🛠️ Agent Architecture & Manifests (SDK Mastery)****

- * ****Learning Objective:**** Master the "Write Agents Once. Deploy Anywhere" standard using the HyperAgent-SDK [14, 15].
- * ****Key Skills:**** Defining `manifest.json`` schemas, using the HyperAgent CLI for validation, and attaching tool plugins (code gen, web search, DB access) to agents [16, 17].

****Module 7: 🐾 Soulful Entities: AI-Native Pets & Memory****

- * ****Learning Objective:**** Build agents with persistent personalities and dynamic state [18, 19].
- * ****Key Skills:**** Implementing Redis-backed memory for real-time stats (hunger, XP), managing long-term interaction history, and understanding the "state split" architecture [17, 18, 20].

Module 8: Web3 Integration & On-Chain Evolution

* **Learning Objective:** Connect AI agents to the blockchain as dynamic NFTs (dNFTs) [18, 21].

* **Key Skills:** ERC-721 smart contract basics, updating IPFS metadata via Python, and wiring `POST /evolve` endpoints to on-chain state changes [20-22].

Module 9: Security & SRE Observability (Hyper-Pro)

* **Learning Objective:** Secure your AI infrastructure and monitor it like a Site Reliability Engineer (SRE) [5, 23].

* **Key Skills:** Wiring Prometheus, Grafana, Loki, and Tempo; implementing VenomEep prompt injection guards; and setting up role-based access control (RBAC) [12, 21, 23].

Module 10: Ship, Scale & Graduate (Hyper-Pro)

* **Learning Objective:** Final production deployment, integrating payments, and achieving "BROski Elite" status [4, 5, 19].

* **Key Skills:** Stripe Checkout integration, managing a BROski\$ token economy, using the HyperAgent Studio Cluster Builder for swarm deployment, and the `npm run graduate` workflow [9, 16, 24].
