

Module 1: 🌱 Your First Vibe — Lesson Plan

This lesson is all about building your **"Empire in a Box."** No boring lectures. No corporate fluff. Just you, your brain, and your first 32-container AI lab. [1, 2]

🪝 The Hook: Stop Asking for Permission

Traditional guides scatter your focus. They judge you for needing five rounds to "get it." **Not here.** [3]

Imagine launching a **living cognitive architecture**—a swarm of AI agents that heal themselves while you sleep—with just three commands. [4, 5]

Today, you stop apologising for how your brain works. Today, you just **build.** [6]

🏃 Step-by-Step Tasks

1. **📦 Install the Engine.**

Download and install **Docker Desktop (Version 24+)**. This is the "shipping container" that holds your entire empire. [7, 8]

2. **📁 Grab the Code.**

Open your terminal and **Clone the HyperCode V2.4 repository.** This is your new home base. [9]

3. **🔑 Prepare Your Keys.**

Copy the `.env.example` file and rename it to `.env`. This is where your system "secrets" (like API keys) live. [9]

4. **🚀 Launch the Mission.**

Run `docker compose up -d`. This starts 32 containers at once. Watch the logs—this is the heartbeat of your system. [7, 9]

5. **🖥️ Check Mission Control.**

Open your browser to `http://localhost:8088`. If you see the **Mission Control Dashboard**, you are officially "Autonomously Alive." [9]

**🔧 Mini Project: "The Pet Spark"

Launch a **BROskiPet** locally to see "Soulful Agents" in action. [10]

- * Navigate to the BROskiPets folder.

- * Run the **one-command start**. [10]

- * Visit `http://localhost:8080`.

- * **Goal:** Interact with a pet (like **DonutEep**) and earn your first 5 **BROski\$ coins** for the daily login. [7, 11]

❌ Common Beginner Mistakes

- * ****Docker is Sleeping:**** Your mission will fail if Docker Desktop isn't actually running.
****Check the whale icon!**** [8]
- * ****The Hidden .env:**** Forgetting to rename the ``.env.example`` file. The system won't know your keys without it. [9]
- * ****Port Squatters:**** If you have another app using Port 8080 or 3000, HyperCode can't move in. ****Close other dev tools first!**** [5, 9]

****✅ Completion Checklist****

- * [] ****Docker Desktop**** is installed and running. 🐳 [7]
- * [] ****HyperCode V2.4**** repo is cloned to your machine. 📁 [9]
- * [] ****`.env` file**** is created and validated. 🔑 [9]
- * [] ****32/32 Containers**** show as "Healthy." 🟢 [12]
- * [] ****Dashboard**** loaded at `localhost:8088``. 🚀 [9]
- * [] ****First Task**** completed (Earned +10 Coins / +25 XP). 🔴 [11]

****Next Up:**** ****Module 2: 🎤 Prompt Like a Pro — Learning to speak "Agent."**** [13]
